1   **COMPUTER SYSTEM, BUS INTERFACE AND CONTROL METHOD THEREFOR**

2

3

ABSTRACT

4

5   When a device ID of a second, or subsequent, host computer

6   contends with a device ID of another device that can be

7   connected to a SCSI bus, a reset signal (RST) is applied to

8   a SCSI control bus input of the contending device. The

9   contention is determined by detecting whether a terminal

10 power of the second, or subsequent, host computer is active.
